Utfordringer og
muligheter med
transaksjons-
prosessering i et
åpent miljø.

Et
miniseminar
arrangert av
NCR Corporation

AGENDA

09.15 **Introduksjon** *v/Steinar Høistad, Adm. dir., NCR Norge AS*

09.25 **Hva en leder må vite om transaksjonsprosessering i et åpent miljø**

Traditional On Line Transaction Processing (OLTP) technology was characterised by a central computer - often a mainframe, unintelligent terminals, and a proprietary transaction processing software development and runtime environment. Open OLTP is a computer mechanism that changes the state of the enterprise in real-time while using industry standards which support interoperability across a mixture of computing systems. Aberdeen Group believes that Open OLTP is now a mature enough technology that it should be seriously considered by enterprise management. The business issues that support this conclusion include the advantages of downsizing, lower cost of ownership, and distributed computing.

The presentation examines why OLTP is a powerful technology tool for business. The migration from traditional OLTP to OPEN OLTP, and the benefits it can provide. What buyers should look for in evaluating suppliers and products is also discussed.

Foreleser: Peter S. Kastner, Vice President, Aberdeen Group, Inc.

10.25 **Pause**

10.30 **Synergieffekter mellom transaksjonsprosessering og relasjons-databaser i et åpent miljø**

The advent of multiple-vendor, multiple-machine, multiple-operating system environment opened the floodgate of choice for users of computer systems. Users were free to develop their applications on hardware provided by one vendor, while keeping their options to switch to hardware provided by another vendor. Availability of such technology caused a shift to Client/Server computing with multiple server hardware and operating system platforms. This approach, while permitting downsizing, introduced problems in the areas of administration, maintenance, and redundant data.

Oracle Corporation believes that doing business in the 1990's requires a re-examination of this philosophy. The trend will be towards Open OLTP systems as the backbone of critical business functions. This will require large massively parallel open hardware as well as an industry compliant, open relation database management system. In order to bring critical enterprise data on-line, the hardware and RDMS must provide high system availability, cost effectiveness, data integrity, performance scalability, and interoperability with other systems.

The presentation describes how an organization can take advantage of Open OLTP and Open relation database technologies to enhance their competitive position through the 1990's and into the next century.

Foreleser: Sven Aamodt, Teknisk direktør, Oracle Norge AS

11.30 Pause

11.35 Fremtidens suksessfaktor ved transaksjonsprosessering under UNIX System V

In 1990's, business leaders are facing unprecedented challenges faced with shortened product and service life cycles and intensified global competition, today's managers must have instant access to information in order to successfully compete. It is no longer possible, or affordable, to re-invent information processing tools as user needs grow or expand. The definition and adoption of IT architectural standards is mandatory to release the goals of minimizing training and retraining concentrating on evolving business applications to provide real-world competitive advantages and maximizing information compatibility with other internal and external organization through interoperable IT systems. Under the umbrella of the UNIX International ATLAS architecture the Corporate Hub Environment defines the computing environment that provides business critical commercial processing capabilities centred on transaction processing under UNIX System V. Characteristically this environment will include large data bases, high availability, fast and predictable response times, a large user base and a reflection of business priorities.

The presentation describes the scope of these characteristics, the technology enablers, and the products available now which provide the benefits of open, and interoperable systems.

Foreleser: Scott Hansen, Managing Director, Unix International.

12.35. Avslutning v/Steinar Høistad

12.50. Lunsj

BIOGRAFI OVER FOREDRAGSHOLDERE

Peter S. Kastner, Aberdeen Group

Peter S. Kastner er visepresident med ansvar for "Commercial Systems Practice" i Aberdeen Group. Han er en av bransjens ledende analytikere innenfor OLTP, klient/tjenerarkitekturer, testing og analyser av applikasjoner. Kastner har ledet flere studier vedrørende operativsystem, programvare og databasesystem.

I 1990 forfattet han Aberdeens rapporter; "Transaction Processing into 1990's" og "The Hardware Suppliers", og i 1991 rapporten "Evaluating Options in Microprocessor Multiprocessing". Han holder ofte foredrag på aktuelle industrikonferanser. Han har holdt foredrag for Apple Computer, ASK Ingres Corporation, DEC, Hewlett-Packard, NCR og Stratus Computer.

Tidligere har Kastner vært leder for markedsføring og salg i DEC, Prime, og Stratus Computer. I en periode var han konsulent i Arthur D. Little Inc.

Peter S. Kastner har vært involvert i flere system utviklingsprosjekter, med stormaskiner, minimaskiner og arbeidsstasjoner, innenfor handel, bank og finans, helsevesen og offentlig sektor.

Scott Hansen, Unix International

Scott Hansen er "Managing Director" i Unix Internationals avdeling i Europa. Han var tidligere ansatt i AT&Ts EDB seksjon i USA. I den siste tiden i AT&T var han "Application Development System Director" med ansvar for utvikling og vedlikehold av UNIX for distribusjonsmiljø.

I tillegg hadde han ansvaret for AT&Ts programvareprodukter. I den forbindelse var han medvirkende i beslutningen om valg av UNIX som operativsystem i AT&Ts nettverksløsninger.

Scott Hansen har "Bachelor Science" grader i dataviten-skap, bedriftsledelse og statistikk fra Kansas State University. Videre er han Master of Science i "Industrial Engineering". Hansen satt i X/Open's styre på vegne av AT&T.

SITATER FRA KONSULENTER OG DATAPRESSEN

Dataquest/Ledgeway

"...The May 1991 merger with AT&T strengthened NCR's position as an leader in open systems and cooperative computing across standards. NCR absorbed AT&T's Computer Systems Division, folding AT&T's substantial communications and networking expertise and services into its offerings. ..."

Aberdeen Group, Inc.

"NCR has positioned itself in a high-growth area: open, integrated systems based on industry standards. Its vision of developing a world class service portfolio reflects this position. ..."

"Now you can get the best open OLTP environment on a wide variety of systems. This (agreement with Independence Technologies Inc.. to port NCR TopEND to multiple systems) is a milestone in the advancement toward open OLTP. ..."

INFOWORLD

"The pieces of the puzzle are rapidly falling into place. People can now consider mission-critical OLTP on the price/performance curve of open systems."

"...NCR (the combined operations of NCR and AT&T Data Systems) is investing heavily in multiprocessor designs for enterprise systems, workgroup software, and hardware and software extensions for pen and multimedia support. So its reps can also walk into customer's office and say with credibility that NCR's products can solve real business problems."

DELTAGERE

Aaraas, Halvor	Den norske Bank AS	Oslo
Aasen, Olav	Novit AS	Trondheim
Bragstad, Thor	Fokus Bank AS	Trondheim
Einertsen, Terje	Teamco AS	Oslo
Glendrange, Jan Petter	Fellesdata AS	Oslo

VEDLEGG

NCR TOP END, brosjyre

Transaksjonsprosessering for system brukere. Programvaren NCR TOP END støtter den nye X/Open standarden for transaksjonsprosessring. Den kan brukes mot åpne databaseverktøy som Informix, ORACLE og Sybase - inkludert i versjoner for parallellprosessering.

NCR Model 3550, brosjyre

NCRs Model 3550 arbeider under den nye UNIX V.4 multiprosessorstandarden. Den er tilgjengelig for OSI og forøvrig X/Open godkjent. Ved å kombinere opptil åtte Intel i486 prosessorer - hver på 50MHz - kan den nye NCR maskinen håndtere opp til 320 (MIPS) millioner instruksjoner i sekundet. Det betyr, at den kan drive over 1.000 arbeidsplasser - enten direkte eller i lokalnett (LAN).

The World of NCR, brosjyre
